

The smart thinking behind the new generation Superglass.

Every Superglass product now contains THINKTECH. But THINKTECH isn't just some clever new ingredient. It's a whole new approach that's improved every aspect of our insulation.

Together with a Zero Ozone Depletion Potential (ODP), this has all enabled Superglass products to easily achieve a Generic BRE Green Guide rating of A+.

Superglass is a member of the Supply Chain Sustainability School, an industry led organisation at the forefront of sustainability, strategy and best practice.

THINKTECH takes recycled glass and improved fibre technology and combines them with advanced glass chemistry expertise to produce our best-performing insulation ever. Our latest generation products look better, smell better, feel better, compress further and recover faster – thanks to new state of the art furnace and advanced processing equipment.

Perfect with renewable energy systems

THINKTECH recognises that insulation is just part of the environmental equation too.

However many homes are built with the latest ultra-efficient renewable energy technologies, those expensive systems are of little value if the energy they produce simply escapes into the atmosphere.

That's where Superglass and THINKTECH come in, wrapping the building envelope to maximise energy efficiency and minimise carbon emissions and household bills.
